                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          \delta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarinoma, carcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 620 TGGACACGCTCAGGCTGCCGTCCAGCTACATCGCCCACTTGAGGCAGATCCTGGCTAACG 679

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for antineoplastic activity, determining a change in comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in qene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the agent. M1 can be used in the treatment of cancer such properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidhey, prostate or pancreatic cancer, adilitrating lobular cancer, squamous call carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Horrigan S;

The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or infantifying an agent that modulates the onset or progression of BPH.

The method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate (I) comprises the expression levels of normal prostate tissue. (I) comprises detecting the expression levels of one or more genes in prostate cells from the subject that are differentially regulated compared to normal prostate cells. (II) comprises preparing a first gene expression profile of prostate cells. (II) comprises preparing a first gene expression profile of prostate cells. (II) comprises preparing a first gene expression profile of substitution of BPH cells or BPH-like cell population, exposing the cells to the agent exposed cells, and comparing the first and second gene expression profiles. (I) is useful for diagnosing the first and second gene expression of BPH. The methods are useful to present information identifying the expression of given in the specification in the tissue or cells to the level of expression level in BPH. Agent expression level of genes of the last no gene in the database, and displaying the expression level of prostate cancer. ABK64106-ABK64860 represent human benign prostatic hyperplasia gene sequences of the invention

Claim 1; SEQ ID NO 1307; 2922pp; English.

diseases

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABC\$4131-ABC\$5305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polynucleotides, antibodies and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumnours of ovarian or orders norders such conditions include ovarian cancer, and breast cancer, and disorders (e.g., infertility, disorders of pregnancy, anovulation, clisorders, infections (e.g., chlampadia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginatials), inflammatory conditions (e.g., mastitis, ophoritis and immunodeficiencies, autoimmune cophoritis, systemic lupus erythematosus), blood-related disorders, or anaemia), cardiovascular disorders and urinary system disorders. Ovarian antigen polypeptides and polymucleotides may also be used in screening for compounds which cutcher be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the

```
Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological
                                                                                                                                                                                       Human, ovarian antigen, ovary, ovarian; breast, cancer, tumour, ovarian cancer, breast cancer; tumour, reproductive system disorder; infertility, pregnancy disorder, anovulation, polycystic ovary syndrome, PCOS; ovarian cyst, dysmenorrhoea, endocrine disorder, infection; inflammatory condition; immune disorder; blood disorder, cardiovascular disorder; respiratory disorder; neurological disorder;
                                                                                                                                                                                                                                                                   gastrointestinal disorder; urinary system disorder; drug screening; gene therapy, chromosome mapping; forensic analysis; and antibody preparation; cyrostatic; immunomodulatory; neuroprotective; antiinflammatory; gynaecological; reproductive; gene; ss.

```
polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigan of the present invention. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                 316

The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytositatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Horrigan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for anti-neoplastic agent involves exposing cells to a agent to be tested for anti-neoplastic activity, and determining in expression of a gene of a signature gene set.

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 8447 sequences (st. where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocationma, carcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chemical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           change

The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or identifying an agent that modulates the onset or progression of BBH.

CC The method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate

CC The method is based on changes in gene expression in BPH tissue isolated comparated to normal prostate tissue. (I) comprises compared to normal prostate tests in prostate cells from the subject that are differentially regulated compared to normal prostate cells. (II) comprises preparing a first gene expression profile co f BPH cells or BPH-like cell population, exposing the cells to the agent, preparing a second gene expression profile of the agent exposed cells, and comparing the first and second gene expression of BPH. (II) is useful confenting an agent that modulates the onset or progression of BPH. (IC) is useful confentifying an agent that modulates the onset or progression of genes cells, in a tissue or cells, by comparing the expression level of genes confent in the database, and displaying the expression level of expression of gene in the database, and displaying the expression level confent least one gene in the tissue or cells to the level of expression level in BPH. Agents using (II) are useful for treating BPH or prostate cancer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynuclectide comprising any one of 38043 CDNA sequences, appearing as ACH12789-ACH5081, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynuclectide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing bloidiversities, or in identifying mutations responsible for generic disorders and other traits. The nuclectide sequences are also useful as hybridisation probes, as oligomers for PCR, for knownscene and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNM. The purified polypeptide is useful for generating antisense DNA or RNM. The purified polypeptide is useful for generating antisense DNA or RNM. The purified polypeptide is one of the 38043 isolated CDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       793
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        853
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             913

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH5081, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polyapeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences of are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide corresponsible for genetic disorders and other traits. The nucleotide corresponse and gene mapping, in the recombinant production of for chromosome and gene mapping, in the recombinant sequence correction, or in generating antisoense by or RNA. The purified polypeptide correction, or in generating antibodies specific for it. The present sequence is one of the 38043 isolated CDNA/RST sequences. Note: The sequence data correction of the printed specification, but was considered in electronic format directly from USPTO at correction, correctly from USPTO at correctly and correctly from USPTO at correctly and correctly from USPTO at correctly and correctly from USPTO at correctly correctly and correctly from USPTO at correctly from USPTO at correctly and correctly and correctly from USPTO at correctly and correctly from USPTO at correctly and correctly from USPTO at correctly and correctly 1093 CCAGAGGAGATCAATTGTACTTACAAAGATTCCCATCTATTTAACTTTAACTTTAACTTCTAC 1033 414 useful 415 ceresargacrerecasecerrecreserecaserecas aratrarararararara 474 EST; Human, 88; sequencing by hybridisation; SBH; expressed sequence tag; genome mapping; biodiversity; genetic disorder. " polynucleotide sequences obtained from various cDNA libraries, u hybridization probes, as oligomers for PCR, for chromosome and ge pping, in the recombinant production of protein, or in generating 3 Jones

derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                       120
                                                                                                                                                                                                                                                                                                                                                                               138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranalated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences

pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-2-like or non-BRCA-1ike tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at

The invention relates to a novel method for detecting cancer. The novel method involves measuring the expression level of a polypeptide encoded by a DNA having a sequence chosen from 119 fully defined sequences such as 416, 265, 456, 376, 360, 245, 280, 288, 221, 391 nucleotides etc., as given in the specification, or a DNA that hybridizes to the above DNA. Under stringent conditions. The invention further relates to: a diagnostic test of cancer, a DNA which encodes a cytotoxic protein and is coupled with a functional promoter region of a cancer detecting DNA; a cettor having cytotoxic DNA inserted in it; a transformed cell containing the staid vector; a method for evaluating the presence or absence of anticancer activity in a test sample; and producing a composition, by mixing a sample evaluated by the anticancer activity detection method and a carrier. The novel polynucleotides have cytostatic activity. The vector containing a cytotoxic polynucleotide can be used to treat cancer by gene therapy. The novel method of the invention allows early detection of cancer. This polynucleotide represents one of the 119 DNA sequences useful in the method for detecting cancer of the invention.

polymuclectide probes comprising a sequence selected from one of the 1490 comprised mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polymuclectides. The microarray is particularly useful in the fagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, of prensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and tore developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a suppopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding compination is algoraling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzheimer's disease can part disease. The present sequence represents a polymuclectide probe of the invention. Note: The sequence attention and lectronic form part of the printed specification but was obtained in electronic contact directly from USPPO at the sequence data for this patent in the contact of the printed specification but was obtained in electronic contact.
                                                     Combination of polynucleotide probes, useful as array elements in microarray for monitoring the expression of a number of target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            seqdata.uspto.gov/sequence.html?DocID=06500938B1

```
The invention relates to a composition of polynucleotide probes comprising at least a portion of a gene encoding a receptor-like polyapetide, second polynucleotide probes comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynucleotides. The microarray is useful in the clauropathology. It can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of max may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of max and treatment of cancer, e.g. cancers of max also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, an immunopathology, e.g. dementia, amnesta, chis patent did not form part of the printed specification but was contained in electronic forme part of the printed specification but was contained in the printed specification but was
                                                                                                                                                                                                                                                                                                                                 New composition comprising polynuclectide probes, useful as array elements in a microarray for monitoring the expression of target polynuclectides or purifying a subpopulation of mRNAs, cDNA, or genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          448 AAGGCGCCCACCAAGAAGAACCCCCTGAGCGGGGTCAGCCA-GGAGGGGAAGCAGGTCCA

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 22, Sequence 22, Sequence 49, Sequence 120, Sequence 120, Sequence 120, Sequence 120, Sequence 120, Sequence 120, Sequence 10, Sequence 10,

Sequence 11, Application US/07891942G

Sequence 11, Application US/07891942G

Patent No. 5579511

GENERAL INFORMATION:

APPLICANT: Kwon, Byoung Se

TITLE OF INVENTION: A REGULATORY PROTEIN IN THE MELANIN PROTEIN PATHWAY

NUMBER OF SEQUENCES: 16

CORRESPONDENCE ADDRESS:

ADDRESSEE: Christopher A. Michaels, Barnard, Brown &

ADDRESSEE: Michaels

STREET: 306 East State Street, Suite 220

Sequence 120, Application US/08053131

Patent No. 5661016

GENERAL INFORMATION:
APPLICANT: Lonberg Nils

TITLE OF INVENTION: Transgenic No. 5661016-Human Animals for TITLE OF INVENTION: Producing Heterologous Antibodies

VORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend Khourie and Crew
STREET: One Market Plaza, Steuart Tower, Suite 200

                                                                       The present sequence is that of Incyte clone 3340296 encoding new human protein regulating gene expression PRGE-23 (see AAYS8630). The cDNA was initially isolated from spleen tissue cDNA library SPLNNOT10, and the full-length sequence assembled from overlapping clones from a number of libraries. PRGE-23 is expressed in reproductive, developmental and urologic tissues associated with cancer, inflammation and foctal diseases, disorders or conditions. It is characterised as an Myc-type HiH protein. The invention provides PRGE polypeptides (see AAYS8608-38) and polynucleotides (see AAZS7839-68), expression vectors, host cells, antibodies, agonists and antegonists. It also provides methods for diagnosing, treating or preventing disorders associated with expression of PRGE. Polynucleotides are also used as sources of probes and primers for diagnosis and monitoring of disease, also for detecting related sequences and in gene mapping
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ArgAsnAlaAlaAsnAlaArgGluArgAlaArgMetArgValLeuSerLysAlaPheSer 100

The invention relates to an isolated polymucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polymucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense DNA or RNA. The purified polypeptide is useful for generating antisense specific for it. The present sequence is one of the 38043 isolated cDNA/BST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 8447 sequences (given in ABL61664 of ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, andenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LysProGluSerAspLeuLysGluValValThrAlaSerArgLeuCysGlyThrThrAla 178

The present invention describes a method (M1) for screening for an antineoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in comprises a sequence (S) selected from 847 sequences (Siven in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gane therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarinoma, carcinoma, clear call cancinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's cell
ant to be tested for anti-neoplastic activity, and determining a change expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        119 AspThrLeuArgLeuAlaSerSerTyrIleAlaHisLeuArgGlnIleLeuAlaAsnAsp

The invention relates to a method of diagnosing (I) the onset or progression of benign prostatic hyperplasia (BPH), or screening (II) for or identifying an agent that modulates the onset or progression of BPH.

The method is based on changes in gene expression in BPH tissue isolated from patients exhibiting different clinical states of prostate isolated to mormal prostate tissue. (I) comprises of prostate cells. (II) comprises of the expression levels of one or more genes in prostate cells from the subject that are differentially regulated compared to normal prostate cells. (II) comprises preparing a first gene expression profile of BPH cells or BPH-like cell population, exposing the cells to the supersing the first and second gene expression profile of BPH cales are useful to mose to repression profile of the agent exposed cells, and comparing the first and second gene expression profile. (II) is useful for diagnosing the onese to progression of BPH. The methods are useful to present information identifying the expression of genes given in the specification in the tissue or cells, by comparing the expression level of expression level in the specification in the tissue or cells to the level of expression level in the database, and displaying the expression levels of a Least one gene in the database, and displaying the prostatic cancer. ABR64106-ABR64106 represent human benign prostatic progression compared to the prostate cancer. ABR64106-ABR64106 represent human benign prostatic
                                                                                                                                                                      Identifying drugs for and diagnosing benign prostatic hyperplasia, by detecting expression levels of one or more genes in prostate cells from patient that are differentially regulated compared to normal prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BP; 190 A; 164 C; 156 G; 180 T; 0 U; 7 Other;

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABD54131-ABD55305), and also encompasses polypeptides 90% identical and polymucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to recombinant vectors and host cells comprising human ovarian antigens of ovarian antigens of ovarian antigens of ovarian antigens of ovarian or breast cancer and treating, prognosing or preventing various ovary and/or breast cancer, and casorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast corigin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, collocated disorders (e.g., chlamydia, HV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and cisorders, inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired thouse conformations, autoimmune ophoritis, systems isorders, neurological disorders, gastrointestinal disorders. blood-related disorders, neurological disorders, gastrointestinal disorders. Compounds which modulate ovarian antigen expression or activity. The polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used as food additives or to prepare antibodies classful in disease diagnosis, drug targeting and phenotyphng. The present sequence represents cDNA encoding a human ovarian antigen of the printed specification, but was obtained in electronic format directly from the printed specification, but was obtained in electronic format directly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ovarian

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnosts and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, forensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs array can detect changes in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose for different signaling pathway populations and leukaemia, immunopathies e.g. Alzheimer's disease in manual assemble e.g. Alzheimer's disease and parkinson's disease to expresents a polynucleotide

The invention relates to a composition of polynucleotide probes comprising first polynucleotide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynucleotide probes comprising at least a portion of a gene encoding a transducing polypeptide and third polynucleotide probes comprising at least a portion of a gene encoding a transducing of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring
                                                                                                                                                                                                                                                                                                                                                  90 GCCCGCATGCGAGTGCTGAGCAAGGCCTTCTCCAGACTCAAGACCACCAGCCTGGGCTGGGTG 149

the expression of target polynucleotides. The microarray is useful in the diagnosis and treatment of cancer, an immunopathology or a neuropathology. It can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the altered expression of diseases that may be associated with the altered expression of diseases to polypeptides. The composition can also be used to purify a subpopulation of finds. Oppopulation of finds. Oppopulation of finds, or genomic fragments in a sample. The expression profile is also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, on immunopathology, e.g. Alzheimer's disease or depression. This sequence represents a ulcerative probe of the invention. Note: The sequence data for this patent did not form part of the printed specification but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ss; sequencing by hybridisation; SBH; expressed sequence tag; BST; mapping; biodiversity; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene

The invention relates to an isolated polynucleotide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (Sequencing by hybridisation). Also included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (BST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations responsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, or chromosome and gene mapping, in the recombinant production of protein, or in generating antibodies by the purified polypeptide is useful for generating antibodies specific for it. The present sequence is useful did not form part of the printed specification, but was for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Musculin; basic helix-loop-helix; bHLH; transcription factor; myogenesis; screening; myogenic disease; abberation; muscle development; cytostatic; gene therapy; diagnostic agent; muscular dystrophy; myopathy; neuromuscular; skeletomuscular; myogenic cancer; human; ss.

New regulatory protein useful for gene therapy of myogenic cancer and for detecting aberrations in muscle development in myogenic disease, comprises protein associated with genes involved in myogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          LeuProTrpValProProAspThrLysLeuSerLysLeuAspThrLeuArgLeuAlaSer 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Musculin; basic helix-loop-helix; bHLH; transcription factor; myogenesis; screening; myogenic disease; abberation; muscle development; cytostatic; gene therapy; diagnostic agent; muscular dystrophy; myopathy; neuromuscular; skeletomuscular; myogenic cancer; mouse; ss.
                                                                                                                                                                                                     The present cDNA sequence encodes human musculin bHLH (basic helix-loophelix) protein, which is a transcription factor associated with genes from lim genesis. Musculin gene can be used in genetic screening for myogenic disease conditions, for detecting abberations in muscle development and in gene therapy. Anti-musculin natioodies can be used as therapputic or diagnostic agents. Musculin has eyeotatic activity and can be used to treat myogenic disease conditions like myopathies, muscular dystrophies, neuromuscular and skeletomuscular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /product= "Murine musculin bHLH protein"

Wasculin gene can be used in genetic screening for myogenic disease conditions, for detecting abberations in muscle development and in gene therapy. Anti-musculin antibodies can be used as therapeutic or disposetic agents. Wasculin has cytostatic activity and can be used to treat myogenic disease conditions like myopathies, muscular dystrophies, neuromuscular and skeletomuscular disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       662
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, ss; differential expression; foam cell; LPS; lipopolysaccharide; cardiovascular disease; atherosclerosis.
                                                                                                                                                      New regulatory protein useful for gene therapy of myogenic cancer and detecting aberrations in muscle development in myogenic disease, comprises protein associated with genes involved in myogenesis.

The invention relates to a combination comprising several polymucleotides having any one of 127 sequences (S1) such as the sequence of human complements of standarding ages, human mRNA for KIAAO310 protest, leadworfines A4 hydrolase, human mRNA for KIAAO310 protest, leadworfines A4 hydrolase, human G1-142 protein mRNA, human K+ channel beat 2 subunit complements. The cDNAs are differentially expressed in LBS (lipopolyaaccharide)-treated foam cells. Also included are containing an extended or full length gene from a library of nucleic acid sequences, an expression vector containing the nucleic acids, a host cell containing the vector, a purified polypeptide appearing as ABE25750 and ABE25751, producing a protein by culturing the host cell, and a composition comprising a purified antibody that specifically binds to the proteins. The foam cell-expressed nucleic acids are useful for a high throughput detection of differential expression of one or more polymucleotides in a sample. The sample is from a subject with a theorem comparison with a standard defines early, mid or late for high throughput screening of a library of molecules or compounds to identify a ligand which binds a polymucleotide. The library is chosen from DNA molecules, peptides, proteins and RNA molecules. The protein is useful for a high throughput screening of library of molecules or compounds to electin, for purifying a ligand from a sample for making a antibody. The foam cell-expressed mucleic acids are useful for cell-expressed mucleic acids are useful for compounds to identify at least one ligand which specifically binds a proteins are sample for making a antibody. The foam cell-expressed mucleic acids are useful for cell-expressed mucleic acids are useful for cell-expressed mucleic acids are useful for man part of a mucleic acids are useful for man expressed and the protein for cell-expressed mucleic acids are useful for man expressed and the protein are useful for man expressed and the protein are negative forms and the protein and the prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  foam cell-expressed nucleic acids are useful for diagnosing cardiovascular disorder. The foam cell-expressed nucleic acids are useful as elements on a microarray which can be used for detecting related polynucleotide in a sample, diagnosing cardiovascular disease, atherosclerosis. The present sequence represents a cDNA whose expression is upregulated in LPS treated foam cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LeuProTrpValProProAspThrLysLeuSerLysLeuAspThrLeuArgLeuAlaSer 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       857 craccordádracocococacacraadorocaadorodacacacocrodacradoroda 916
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human nucleic acid-binding protein; NuABP; agonist; antagonist; EST; expressed sequence tag; drug screening; recombinant expression; antibody; reproductive disorder; infertility; immunological disorder; neurological disorder; cell proliferative disorder; cancer; tumour; ss.
                                                                         Combination containing several polynucleotide that are differentially expressed in foam cells and complements of the polynucleotides, useful for diagnosing cardiovascular disease or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 2177 BP; 423 A; 691 C; 650 G; 413 T; 0 U; 0 Other;

Sequences AAA72382-A72416 represent CDNAs encoding novel human nucleic acid-binding proteins (NuABPS; AAB20997-B21051). These CDNAs were produced by extension from an appropriate EST (expressed sequence tag) using primers designed using the EST. The invention also relates to wind primers designed using the EST. The invention also relates to expression constructs, host cells and transgenic organisms comprising a nutibodies against the human NuABPS, and also to methods of screening antibodies against the human NuABPS, and also to methods of screening condulators of human NuABPS, and also to methods of screening condulators of human NuABPS, and their agonists are used to treat diseases associated with overexpression or underexpression of functional NuABPS. Human NuABP proteins and nucleotides, and NuABP agonists and antagonists can be used to disagnose, treat and prevent reproductive, immunological, neurological, compositions of the invention include infertility, and compositions of the menstrual cycle and disruptions of the menstrual cycle and disruptions of spermatogenesis. Immunological disorders that may be treated include spermatogenesis. Immunological disorders such as multiple sclerosis, neurodegenerative conditions such as Alzheimer's disease and Parkinson's disease, prion diseases such as Creutzfeldt-Jakob disease and mental disorders such as schizophremia. Cell proliferative disorders that may be treated include a wide variety of cancers, and also arteriosis, cirrhosis and psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LeufroTrpValProProAspThrLysLeuSerLysLeuAspThrLeuArgLeuAlaSer 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       916
                                                                                           Novel nucleic acid binding proteins, used to identify agonists and antagonists of them, for the treatment of reproductive, immunological, neurological and cell proliferative disorders including cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2196 BP; 438 A; 691 C; 653 G; 414 T; 0 U; 0 Other;

This invention relates to novel isolated cDNAs that are differentially expressed in MYCN activated cells. Specifically, it refers to polymucleotide sequences that exhibit differential expression patterns in cells activated by the transactivator MYCN, where MYCN is a protoconcern that is amplified in neuroblastoma cells and is common in small oncogene that is amplified in neuroblastoma cells and is common in small cell lung cancers. The present invention describes these CDNA molecules as useful for in hybridisation assays to detect expression of nucleic acids (or complementary nucleic acids) in a present in a given sample, as well as for screening assays by identifying molecules or compounds that specifically bind the CDNA as a ligand and modulate function or activity. Accordingly, these compositions exhibit cytostatic activity and can also be used for gene therapy purposes. This polymucleotide sequence is a CDNA that is differentially expressed in MYCN activated cells, given in an expension of the invention. NOTE: This sequence does not appear in the US Patent Office at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LeuProTrpValProProAspThrLysLeuSerLysLeuAspThrLeuArgLeuAlaSer 125

The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during foam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotide sequences can also be used as the primers and probes. The polynucleotide sequences can also be useful in gene therapy. AAS94746-AAS95021 represent the human polynucleotide sequences of the invention are also expressed during foam cell differentiation
